

# (loc & iloc)

0.

Python / VS Code / pip install numpy, pandas    pip install numpy pandas

Colab    <https://colab.research.google.com>

Anaconda / Jupyter    jupyter notebook

## 1. Numpy

```
array() / ndarray    np.array([1,2,3])    array([1,2,3])  
                    np.array([1,2,3]) + np.array([4,5,6])    array([5,7,9])  
: shape / ndim / size / dtype / itemsize  
/                    a[0], a[:,1], a[a>3]
```

## 2. Pandas

```
Series    pd.Series([10,20,30], index=['a','b','c'])  
DataFrame    pd.DataFrame({'name':['A','B'],'score':[90,80]})  
head()/info()/describe()
```

3.

```
(NaN)    df.isnull(), df.fillna(0), df.dropna()  
/                    df.sort_values('score'), df[df['score']>80]  
.loc (                    )    df.loc[0,'name'], df.loc[df['score']>=85,['name','score']]  
.iloc (                    )    df.iloc[0,0], df.iloc[0:2,0:2]  
groupby()    df.groupby('class')['score'].mean()  
concat()/merge()    pd.concat([df1,df2]), pd.merge(df1,df2,on='id')
```

4.

```
CSV    pd.read_csv('data.csv'), df.to_csv('out.csv', index=False)  
Excel    pd.read_excel('data.xlsx'), df.to_excel('out.xlsx')
```

5.

```
mean(), median(), max(), min(), std(), corr()
```

6.

```
astype()    df['score']=df['score'].astype(float)  
to_datetime()    df['date']=pd.to_datetime(df['date'])
```

7.

```
Numpy                    a*np.array([1,2,3])*2
```

```
Pandas      df['avg'] = (df['mid'] + df['final'])/2
NaN          df.fillna(df.mean())
/           /           sort_values(), groupby(), merge()
```
